## CARE INSTRUCTIONS

### *textile motorcycle clothing with leather*

**The durability and functionality of any garment also depends on proper care.  
So please always note the sewn-in care label.**

Regular washing does not harm the GORE-TEX membrane. Rather it ensures a high life expectancy and constant functionality of the garment.

Before washing motorcycle clothing, always remove the protectors first, close Velcro and zippers and snaps!

#### **WASHING**

Please make sure that you pay attention to the sewn-in care label!

If not stated otherwise, select hand wash (with pH neutral soap and lukewarm water). NO machine washing!

Remove heavy soiling on the leather areas in advance with a damp cloth or soft brush.

To avoid detergent residues on the GORE-TEX material, rinse sufficiently clear (Repeat the rinsing process).

**Do not use fabric softener!!!**

#### **IRONING**

Do not iron motorcycle clothing made of leather.

#### **LAUNDRY DRYER**

Not into the laundry drier. Dry at room temperature. Do not dry in the sun!

#### **BLEACHING**

Do not use any chlorine bleach.

#### **DRY-CLEANING**

No dry-cleaning.

**Advice:** in case of perforated leather, it is recommended not to use any leather grease, since this is rubbed into the perforation, and the leather does not absorb it. This results in unattractive residues in the perforation.

The leathers used in combination with GORE-TEX are highly breathable and therefore not treated with an additional covering color layer. This may affect the color stability of the leather.

We suggest:

#### **IMPREGNATION**

Impregnation in no way impairs the function of the GORE-TEX membrane. Quite the contrary, well-impregnated clothing repels dirt and water. A soaked outer fabric causes heat loss. So a good impregnation therefore protects against cold as well. The shell fabric of the garments with GORE-TEX product technology are already impregnated at the time of manufacture.

Our motorcycle clothing is equipped with a factory impregnation that allows water to bead off and thus prevents the outer shell from becoming soaked immediately. However, this water and dirt repellent layer does not last permanently. Even superficial contamination and dirt, but also proper washing of the clothing reduces the effect of the impregnation. However, this can be reactivated and restored and is therefore not a reason for complaint.

The beading effect can be reactivated by a short heat treatment at low temperature in the dryer or by ironing (without steam/with cloth between garment and ironing sole) according to the care label.

Depending on the usage, but at the latest when water no longer beads off as usual, the clothing should be treated with a waterproofing agent suitable for breathable clothing. Leather can be handled with lotion or foam meant for leather care.

#### **REPAIR**

In spite of all caution, the clothing can become damaged. Even small tears and holes cause water to get inside, in the case of water-proof clothing. Due to the special construction of the GORE-TEX clothing, such damages should be repaired only by a specialist. In this case, please contact your retailer or our sales team.

#### **Attention:**

**Only washed garments will be repaired!**
